

How to get CC.

Cartographer

So where does sellers of -|- take a material?

how to hack shop and use different injections and so on. I can just tell that not so few shops use standart php packets like Mamba, OsCommerce and shiet like these. There are a plenty of vulnerabilities in it so itâ s possible to catch the moment of update and use any public vulnerability.

Other variant to get access to shop by catching link, login and password of Panel or Web Hoster Manager (root) for a site, or (attention) is enough access not ANY site your business. They can be bought, collected from logs etc.

Light walk on the administratorâ s CP (control panel):

There are two kinds of HTTP admin CPs. For example we have supercards.com. CP for this site will be supercards.com:2082

For especially difficult peoples: a browser in default connected to site through 80th port (or 8080). So when you type www.google.com it comes to www.google.com:80. So I think no itâ s easy to get that on 2082nd port there is the control panel for this site. So when we have it â we just enter login and password â and thatâ s all ))

The same thing with root access, a difference only that reference port will be 2086, the login will be always identical (root) and the most important third difference that youâ ll be able to operate all sites on the server. For example we have a server 66.111.227.44. We just type in address line 611.227.44:2086, enter login and password, and enter in the root panel.

So next task â to get MySQL database because mainly these CCs you need are in it. What about cpanel, such access lets to get access on any site on hosting. Using FTP-manager we upload php-script which uses apache bugs and lets see all sites on hosting. You can see it in read-only mode but itâ s enough to find access to database â and here you can do whatever you want ) So use phpMyAdmin script or something like you find what you need ))

So thatâ s main and the most effective way ) Not the easiest of course â but the most effective. But there are another ways â sellers donâ t use them because

If you can a lot of logs â enough just enter in search field â CVVâ and receive fresh sample for a day =) Certainly I do not advise to buy sploit, trojan and hosting for it. And of course sellers donâ t get their CC this way ))) That just a variant.

And the last ancient and dead way â fake e-shop. Iâ m not sure if anybody use it anymore â a lot of work and itâ s better to make and popular legal shop and get a little profit for any sales. So you need hosting for it and e-shop (like OScommerce or another I wrote before). Of cours there is nothing to sell )) And we donâ t need it. We just wait for â customersâ who will enter CC data and when we use it ) But I repeat â itâ s not worth it now )

Thatâ s about all I thinkâ f Thatâ s not manual for getting CCâ s â just common info for newbies.
